

To revise my shape knowledge

Sort the shapes on your tables into 2D and 3D shapes.

Discuss on your tables how you knew the difference between the two different types of shapes.

From the 2D shapes find a quadrilateral

What is a quadrilateral?

What do all quadrilaterals have in common?

From the 2D shapes find a quadrilateral

What is a quadrilateral?

What do all quadrilaterals have in common?

Quadrilateral just means "four sides"  
(*quad* means four, *lateral* means side).

**A Quadrilateral has four-sides**, it is **2-dimensional**  
(a flat shape), **closed** (the lines join up), and has  
**straight** sides.

*Some quadrilaterals have specific names.*

*Can you name them?*

What are the properties of these quadrilaterals?

Square

Kite

Trapezium

Rectangle

Rhombus

Parallelogram

## The Rectangle

*the little squares in each corner mean "right angle"*

A [rectangle](#) is a four-sided shape where every angle is a [right angle](#) ( $90^\circ$ ).

Also **opposite sides** are [parallel](#) and of equal length.

---

## The Square

*the little squares in each corner mean "right angle"*

A [square](#) has equal sides (marked "s") and every angle is a right angle ( $90^\circ$ )

Also opposite sides are parallel.

A square also fits the definition of a **rectangle** (all angles are  $90^\circ$ ), and a **rhombus** (all sides are equal length).

## The Rhombus

A **rhombus** is a four-sided shape where all sides have equal length (marked "s").

Also opposite sides are parallel *and* opposite angles are equal.

Another interesting thing is that the diagonals (dashed lines) meet in the middle at a right angle. In other words they "bisect" (cut in half) each other at right angles.

A rhombus is sometimes called a **rhomb** or a **diamond**.

---

## The Parallelogram

A **parallelogram** has opposite sides parallel and equal in length. Also opposite angles are equal (angles "A" are the same, and angles "B" are the same).

NOTE: Squares, Rectangles and Rhombuses are all Parallelograms!

## The Kite

Hey, it looks like a [kite](#) (usually).

It has **two pairs** of sides:

Each pair is made of two equal-length sides that join up.

Also:

- the angles where the two pairs meet are equal.
- the diagonals, shown as dashed lines above, meet at a right angle.
- one of the diagonals *bisects* (cuts equally in half) the other.

---

## Trapezium

with a **trapezium**, one pair of opposite sides is parallel

Sort the 2D shapes by the amount of sides they have.

1 side

3 sides

5 sides

6 sides

7 sides

8 sides

9 sides

10 sides

Octagon

Decagon

Circle

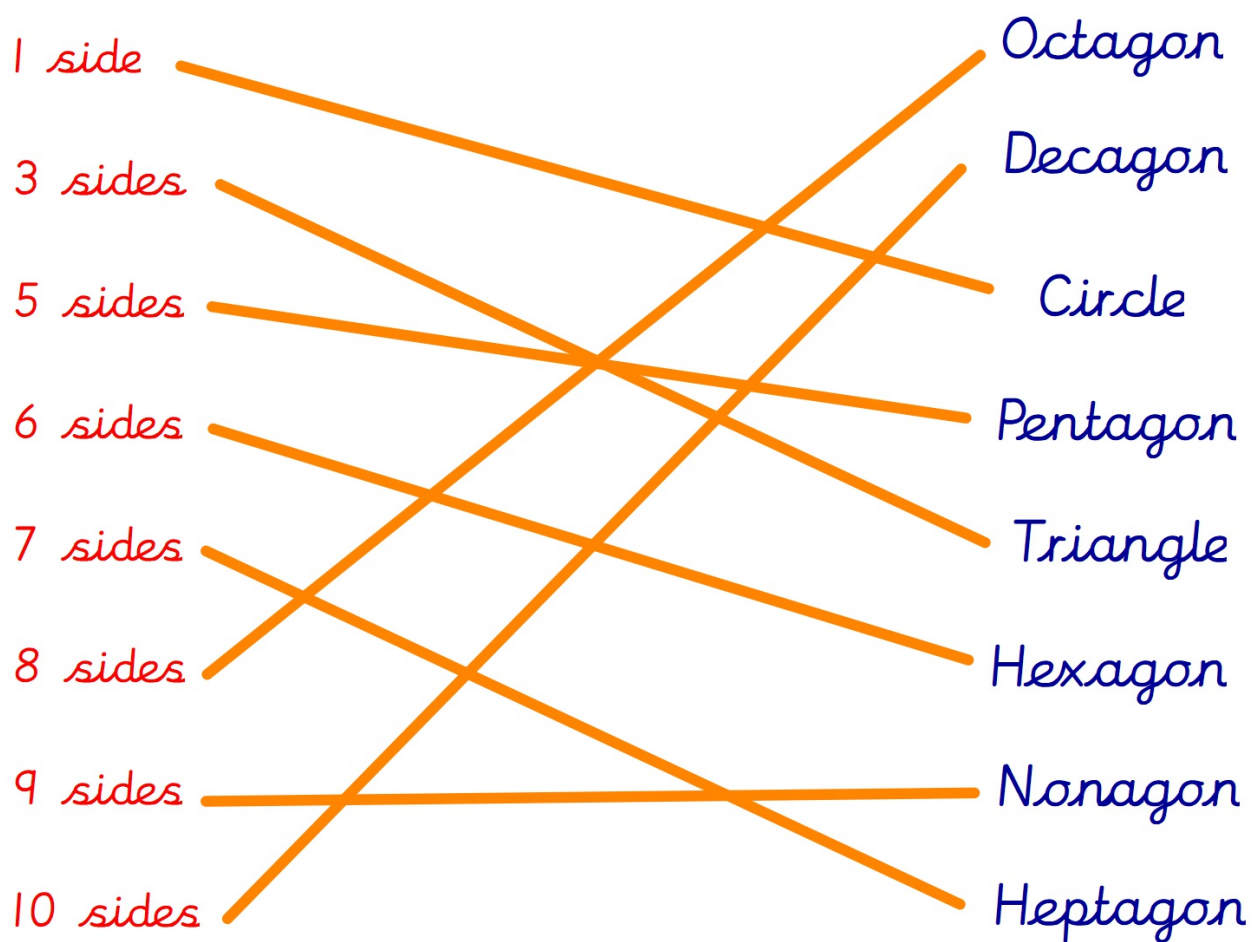

Pentagon

Triangle

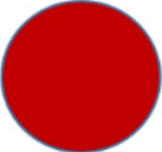

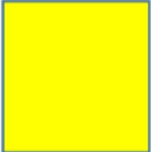

Hexagon

Nonagon

Heptagon

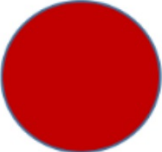

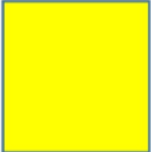

## Regular shapes

						
Circle	Equilateral triangle	Square	Pentagon	Hexagon	Heptagon	Octagon
This is a regular shape but not a polygon because it doesn't have straight sides.	Three equal length sides and three equal interior angles of $60^\circ$ .	Four equal length sides and four interior angles of $90^\circ$	Five equal length sides and five interior angles of $108^\circ$	Six equal length sides and six interior angles of $120^\circ$	Seven equal length sides and seven interior angles of $128.57^\circ$	Eight equal length sides and eight interior angles of $135^\circ$

*What do you notice?*

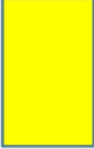

## Regular shapes

						
Circle	Equilateral triangle	Square	Pentagon	Hexagon	Heptagon	Octagon
This is a regular shape but not a polygon because it doesn't have straight sides.	Three equal length sides and three equal interior angles of $60^\circ$ .	Four equal length sides and four interior angles of $90^\circ$	Five equal length sides and five interior angles of $108^\circ$	Six equal length sides and six interior angles of $120^\circ$	Seven equal length sides and seven interior angles of $128.57^\circ$	Eight equal length sides and eight interior angles of $135^\circ$

What do you notice?

All of the sides and angles are even within each shape

## Irregular shapes

						
Right-angle Triangle	Quadrilateral	Rectangle (also a Quadrilateral)	Irregular Pentagon	Irregular Hexagon	Irregular Hexagon	Irregular Octagon
This has three sides and three internal angles, one angle is always at $90^\circ$ .	All four-sided polygons are called quadrilateral but some also have special names like a kite or a rhombus.		This shape has five sides and internal angles that are not all equal.	This shape has six sides and six internal angles that are not all equal.	Here is an example of a completely different hexagon.	This shape has eight sides and eight internal angles that are not all equal.

What do you notice?

## Irregular shapes

						
Right-angle Triangle	Quadrilateral	Rectangle (also a Quadrilateral)	Irregular Pentagon	Irregular Hexagon	Irregular Hexagon	Irregular Octagon
This has three sides and three internal angles, one angle is always at $90^\circ$ .	All four-sided polygons are called quadrilateral but some also have special names like a kite or a rhombus.		This shape has five sides and internal angles that are not all equal.	This shape has six sides and six internal angles that are not all equal.	Here is an example of a completely different hexagon.	This shape has eight sides and eight internal angles that are not all equal.

What do you notice?

The sides and angles are not all equal

**Acute angle**

Less than  $90^\circ$

**Right angle**

Exactly  $90^\circ$

**Obtuse angle**

More than  $90^\circ$

Less than  $180^\circ$

**Reflex angle**

More than  $180^\circ$

Less than  $360^\circ$

*Can you find a 2D shape with each of the following angles?*

# Parallel Lines

Parallel Lines are two or more lines which are going in the exact same direction. They stay the same distance apart.

## Parallel Lines

## Non-Parallel Lines

## 3D shapes

## 3D shapes

Cone

Cylinder

Sphere

Square Based  
Pyramid

Cube

Triangular  
Prism

Tetrahedron

Cuboid

3D shapes can be described in 3 ways:

Faces – the sides of the shape

Vertices – the corners

Edges – where the faces meet

## Properties of 3D shapes

Cone

Sphere

Tetrahedron

Cuboid

Cylinder

Cube

Triangular Prism

Square-based pyramid

## Properties of 3D shapes

<b>Cone</b>  <b>2 Faces</b> <b>1 Edge</b> <b>1 Vertex</b>	<b>Sphere</b>  <b>1 Face</b> <b>1 Edge</b> <b>0 Vertices</b>	<b>Tetrahedron</b>  <b>4 Faces</b> <b>6 Edges</b> <b>4 Vertices</b>	<b>Cuboid</b>  <b>6 Faces</b> <b>12 Edges</b> <b>8 Vertices</b>
